FEnics exercise #8 below, executed by scikit-fem. Note: In this case it is necessary to set the inline backend to "retina", because the .svg backend scrambles the graphic. (Whatever it is, "retina" seems to match vector image quality, so it is considered a player of equal skill.

In [5]:

```
1 r"""
2 This example demonstrates the solution of a slightly more complicated problem
3 with multiple boundary conditions and a fourth-order differential operator. We
4 consider the `Kirchhoff plate bending problem
5 <https://en.wikipedia.org/wiki/Kirchhoff%E2%80%93Love_plate_theory>`_ which
6 finds its applications in solid mechanics. For a stationary plate of constant
7 thickness :math:`d`, the governing equation reads: find the deflection :math:`u
8 : \Omega \rightarrow \mathbb{R}` that satisfies
9 .. math::
10     \frac{Ed^3}{12(1-\nu^2)} \Delta^2 u = f \quad \text{in } \Omega,
11 where :math:`\Omega = (0,1)^2`, :math:`f` is a perpendicular force,
12 :math:`E` and :math:`\nu` are material parameters.
13 In this example, we analyse a :math:`1 \times 1` m^2` plate of steel with thickness :math:`d=0.1`,
14 The Young's modulus of steel is :math:`E = 200 \cdot 10^9` Pa` and Poisson
15 ratio :math:`\nu = 0.3`.
16 In reality, the operator
17 .. math::
18     \frac{Ed^3}{12(1-\nu^2)} \Delta^2
19 is a combination of multiple first-order operators:
20 .. math::
21     \boldsymbol{K}(u) = - \boldsymbol{\nabla \epsilon}(\boldsymbol{\nabla} u), \quad \boldsymbol{\epsilon}(\boldsymbol{\nabla} u) =
22 .. math::
23     \boldsymbol{M}(u) = \frac{d^3}{12} \boldsymbol{C} \boldsymbol{K}(u), \quad \boldsymbol{C} \boldsymbol{K}(u) =
24 where :math:`\boldsymbol{I}` is the identity matrix. In particular,
25 .. math::
26     \frac{Ed^3}{12(1-\nu^2)} \Delta^2 u = - \operatorname{div} \operatorname{div} \boldsymbol{M}(u).
```

```

27 There are several boundary conditions that the problem can take.
28 The *fully clamped* boundary condition reads
29 .. math::
30     u = \frac{\partial u}{\partial \boldsymbol{n}} = 0,
31 where :math:`\boldsymbol{n}` is the outward normal.
32 Moreover, the *simply supported* boundary condition reads
33 .. math::
34     u = 0, \quad M_{nn}(u)=0,
35 where :math:`M_{nn} = \boldsymbol{n} \cdot (\boldsymbol{M} \boldsymbol{n})`.
36 Finally, the *free* boundary condition reads
37 .. math::
38     M_{nn}(u)=0, \quad V_n(u)=0,
39 where :math:`V_n` is the Kirchhoff shear force <https://arxiv.org/pdf/1707.08396.pdf>_. The exa
40 definition is not needed here as this boundary condition is a
41 natural one.
42 The correct weak formulation for the problem is: find :math:`u \in V` such that
43 .. math::
44     \int_{\Omega} \boldsymbol{M}(u) : \boldsymbol{K}(v) \, \mathrm{d}x = \int_{\Omega} f v \, \mathrm{d}x
45 where :math:`V` is now a subspace of :math:`H^2` with the essential boundary
46 conditions for :math:`u` and :math:`\frac{\partial u}{\partial \boldsymbol{n}}`.
47 Instead of constructing a subspace for :math:`H^2`, we discretise the problem
48 using the non-conforming Morley finite element
49 <https://users.aalto.fi/~jakke74/WebFiles/Slides-Niiranen-ADMOS-09.pdf>_ which
50 is a piecewise quadratic :math:`C^0`-continuous element for biharmonic problems.
51 The full source code of the example reads as follows:
52 .. literalinclude:: examples/ex02.py
53     :start-after: EOF"""
